The Contemporary Controls New Ethernet Switch Selector Puts Switch Basics at Your Fingertips

*Switch Selector Instantly and Accurately Chooses
the “Right” Switch for Your Application*

Downers Grove, Illinois (March 9, 2007)—Put Ethernet switch basics at your fingertips! Contemporary Controls offers a **New** Ethernet Switch Selector to help you determine the most advantageous switch to employ in your applications instantly and accurately. You can use it in the office or on site to choose the company’s Plug-and-Play (PnP), managed, configurable, and regulatory switches—all marketed under the CTRLink® trade name. This selector covers applications requiring as few as 5-port unmanaged to 24-port managed switches with copper only or copper plus fiber models.

This easy-to-read selector answers questions for successful deployment including temperature range, port count, multimode or single-mode fiber, connectors, dimensions (in inches), and mounting.

If you’re interested in managed or configurable switches, the selector lists their features such as redundancy options or port VLAN. These and other features enable more efficient network communications.
