Welcome

We are pleased that you have purchased a Sage Metering Mass Flow Meter for your requirement. We hope that you are satisfied with the performance, operation and design of our highly precise, NIST traceable Thermal Gas Mass Flow Meter.

Sage Metering is your source for monitoring, measuring and controlling the gas mass flow in your industrial process, building management system or environmental application. Our high performance, NIST Traceable, Thermal Mass Flow Meters will help increase productivity, reduce energy costs, maximize product yields, and/or help reduce environmental insult. Sage provides high quality In-Line and Insertion Thermal Mass Flow Meters for a wide variety of industrial, commercial, and environmental monitoring needs, including carbon credit verification for Greenhouse Gas reduction.

Sage Meters measure mass flow directly — there is no need for ancillary instrumentation such as temperature or pressure transmitters. Furthermore, our instruments have exceptional signal sensitivity, have no moving parts, require little if any maintenance, have negligible pressure drop and have a turndown up to 100 to 1, and resolve as much as 1000 to 1. Sage Flow Meters can measure the mass flow rate and consumption of air, oxygen, natural gas, nitrogen, digester gas, biogas, flare gas, hydrogen, argon, carbon dioxide and other gases and gas mixes.

Sage Prime is the latest addition to our family of high performance Thermal Mass Flow Meters. It features a bright graphical display of Flow Rate, Total and Temperature, robust industrial enclosure, and easy to access power and output terminals. Sage Prime has a dual-compartment windowed enclosure featuring a very high contrast photo-emissive OLED display with a new photocell activated Screen Saver. The rear compartment, which is separated from the electronics, has large, easy to access and well marked terminals, for ease of customer wiring. It is powered by 24 VDC (12 VDC optional, or 115/230 VAC). The power dissipation is under 2.5 watts (e.g. under 100 ma at 24 VDC for the DC version.)

Please let us know if we can assist you in any way with your Sage Meter, or if you have any questions about its installation, operation, or features. Simply phone us at 866-677-SAGE (7243), or visit our website at www.sagemetering.com to contact a factory representative in your area. (To access this manual on the website, enter in user name: sage; passcode 7243737 when prompted.)

Sincerely,

Robert Steinberg
President
Section A

GETTING STARTED
Getting Started

UNPACKING YOUR SAGE METER

Your Sage flow meter is a sensitive, yet rugged, precision built electronic instrument. Upon delivery, care should be taken when opening the shipping container and removing your meter. The meter should be inspected for any damage that may have occurred during transit. If damage is found, please contact the carrier immediately to place a claim for damaged goods. The contents of the container should be checked against the packing list for any discrepancies. If there are any questions as to the contents or configuration of the equipment including calibration ranges, or, mounting hardware, contact Sage Metering as soon as possible. Please save shipping container and packaging materials (including PVC tube probe protector on Sage Insertion Flow Meters) in case the unit needs to be returned for any reason.

MAINTENANCE

Sage thermal mass flow meters essentially require little or no maintenance. While the sensing element is somewhat resistant to dirt and particulate buildup, it may become necessary to clean it from time to time if mounted in extremely dirty environments. NOTE: ALWAYS REMOVE THE POWER PRIOR TO ANY CLEANING OR MAINTENANCE. A detergent or appropriate non-corrosive solvent for removing the buildup may be required. A soft brush can be used to gently clean the sensing element’s surface, using caution to avoid damaging the sensor elements (the RTDs). If any disassembly is necessary, contact Sage Metering, Inc. for instructions. In general, it is recommended that your Sage Thermal Mass Flow Meter be returned to the factory if cleaning, repair, or recalibration is needed. This is usually the most cost-effective and reliable alternative.

CALIBRATION

Sage Prime has continuous diagnostics. The raw calibration milliwatts (mw) is always displayed in the upper left hand corner of the meter’s display. At any time, you can check this reading at a “no flow” condition and compare the reading to the original reported “zero flow” value noted on the last few lines of your meter’s Certificate of Conformance or the flow meter’s data tag. This diagnostic procedure not only checks the sensor performance and the “live zero” calibration point, but it verifies that the sensor is clean. It essentially provides a means to validate the meter’s performance, verifies that there is no shift or drift, and eliminates the need for annual factory calibrations. This simple field diagnostic procedure also verifies that the sensor is free from contamination, even without inspection. See “In-Situ Calibration Check” on page 46.
INSTALLATION AND MOUNTING

- Check the Certificate of Conformance included with your Sage Thermal Mass Flow Meter for system pressure, temperature, gas composition, power input, and signal output.

- It is recommended that the flow meter be inserted in a location of maximum straight run. It is suggested that there be a minimum of 15 pipe diameters of straight run upstream, and 5 diameters downstream, depending on the conditions. See chart on page 11. Note, obstructions such as valves, blowers, expanders and PVC and HDPE pipes will require additional straight run (contact factory for assistance).

- Check the orientation: Standard calibration flow direction is left to right when facing the flow meter. Gas flow direction is marked with an arrow on in-line flow meters; UPSTREAM is marked on insertion probes.

- Do not rotate probe, or errors may occur. If enclosure is facing incorrectly, rotate the enclosure 180˚, but do not rotate the probe. The UPSTREAM mark still needs to be facing Upstream.

- Hook up the system per the wiring diagram provided with your Sage flow meter (see inside of rear compartment cover for terminal designation). Double check that wiring for the proper power and signal connections are correct.

- Check that all plumbing and electrical hook-ups are in accordance with OSHA, NFPA, and all other safety requirements.

- For Remote Style Meters (SRP) be sure the Remote Electronics is matched with the Transmitter’s Junction Box and its attached Probe or Flow Body. There will be Metal Serial Number Tags on both the Transmitter as well as the Remote Electronics enclosure. Do not mismatch the serial numbers of the Remote Electronics and the Junction Box, or calibration errors will occur.

LOCATING PROPER WIRING DIAGRAM

1) Look at the sticker on your meter. The first three digits describe the basic model that you have. Refer to the appropriate page numbers below for your wiring diagram

2) SIP: see page 19

3) SRP: see page 22 for input/output terminals; see page 24 (Junction Box Wiring Terminals for Remote Style Meters)

WIRING

Follow the instructions below to remove the rear cap for wiring. CAUTION: Do not open the display side!

Before removing the rear cap to access the wiring terminals it is essential to completely remove the screw assembly on the side of the rear enclosure to free up the threads so the lid can be removed. Note there is a Red Tag attached to the screw assembly stating “Remove Screw Before Opening Lid”. After the wiring is completed (see pages 18 to 23 for wiring details), please close the lid, and reinsert the screw assembly in the same manner.

Note: See “Approvals” page for Hazardous Location Approvals (DC Powered Meters Only)

---

1 The Integral Style of Sage Prime Insertion Meters have the Display oriented as shown on page 14. If an alternate orientation of the display, or enclosure is required (ie. installation into a vertical pipe), please furnish a sketch or drawing, and specify “ROTATE” on purchase order. However, if it is later determined that the enclosure needs to be rotated, that procedure can be done in the field. However, if the display needs to be rotated, then the meter must be sent back to Sage to be modified. Do not attempt this in the field. An RMA will be required prior to returning the meter (see page 51). The procedure for rotating the enclosure is as follows: Clam p the enclosure of the Prime in a vise with the probe pointing up to the ceiling. Then take a 7/8 wrench and turn the probe to the proper orientation. Lock the probe into its new position with a set screw (not provided).
Insertion Flow Meter Application

FLOW PROFILE AND INSTALLATION CONSIDERATIONS

Insertion Flow Meters, although generally easier to install that In-Line Flow Meters, require proper installation, and a well developed flow profile, in order to perform properly. Please refer to the section on the following pages titled PROBE INSERTION GUIDELINE DRAWING (page 14) and INSTALLATION DEPTH CHART (page 15).

SAGE VALVE ASSEMBLY OPERATION

Valve assemblies (SVA05 and SVA05LP) are an optional mounting hardware for Insertion Style Flow Meters (see pages 38 and 39). They allow the removal of insertion-style meters for service, cleaning, recalibration, relocation, etc. without the need to “shut-down” your process. The probe insertion depth is adjustable to permit sensor to be located at center to optimize measurement accuracy. (Refer to PROBE INSERTION GUIDELINE DRAWING and CHART, pages 14 & 15.) The ball valve will seal off leaks of the process gas at the point of insertion after the probe assembly has been removed. The assembly includes a valve, threadolet, compression fitting with Teflon ferrule, a cable restraint, and two collar clamps.

A threaded half coupling (3/4" FNPT) properly sized to accommodate the isolation valve retractor assembly must be fitted to the pipe/duct to which the insertion probe will be inserted. Avoid T-Fittings since they will disturb the flow profile, and effectively reduce the measurement area. Direct threading together (or with necessary bushings) of the retractor assembly may be required. In other cases, the threadolet must be welded in place and a clearance hole must be drilled through the pipe/duct to accept the probe assembly. If the pipe/duct is under pressure during installation, a hot tap drill (not available through Sage Metering) may be required.

FLOW CONDITIONING AND STRAIGHT RUN

Although a minimum of 15 pipe diameters of upstream straight run is commonly recommended, to absolutely assure that the flow profile is well developed at the point of measurement, either use Flow Conditioners (standard in Sage In-Line Flow Meters, 1/2" and larger, and also available as assemblies for Insertion Flow Meters, see page 13), or consider additional straight run. The Chart below provides examples of the amount of straight run that would virtually assure that there are no flow disturbances at the point of measurement.

¹ This column applies to In-Line Flow Meters, which come standard with built-in Flow Conditioners, as well as Insertion Meters, when provided with upstream Captive Flow Conditioners (see page 13).

NOTE: Detailed Drawings are shown on pages 38 & 39.
COMPRESSION FITTING OPERATION

A bored through tube fitting, properly sized to accommodate an insertion probe’s particular OD, can be provided by the user or purchased as an option from Sage Metering (see page 38). Prior to installation, a clearance hole to accommodate the insertion probe assembly must be drilled in the pipe/duct. A fitting (1/2” FNPT) is then welded in place or threaded into the half-threadolet which has been welded to the pipe/duct. The probe insertion depth is adjustable to permit sensor to be located at center, to optimize measurement accuracy. (Refer to PROBE INSERTION GUIDELINE DRAWING and CHART, pages 14 & 15.)

INSTALLATION INSTRUCTIONS

1. Insert tubing into the tube fitting.
2. Make sure that the tubing is positioned properly per the PROBE INSERTION GUIDELINE DRAWING AND CHART, pages 14 & 15.
3. Due to the variations of tubing diameters, a common starting point is desirable. Therefore, tighten the nut until the tubing will not turn by hand or move axially in the fitting.
4. Scribe the nut at the 6 o’clock position.
5. While holding fitting body steady, tighten the nut 1¼ turns to the 9 o’clock position.
CAPTIVE FLOW CONDITIONER ASSEMBLY
Can Be Installed in Conjunction with Insertion Style Flow Meters

NOTE: The larger of the two perforated plates of the Sage conditioning basket is positioned between two flanges and two gaskets as shown. The smaller of the two perforated plates of the conditioner will freely slide into the application pipe, facing downstream. The compression will be placed one diameter downstream of the downstream plate.
PROBE INSERTION GUIDELINE DRAWING¹

Choose the longest straight-run section of pipe available to allow a uniform, well-developed flow profile. Allow for a minimum of 15 pipe diameters of straight run upstream, and 5 diameters downstream, depending on the conditions. See chart on page 11. Note, obstructions such as valves, blowers expanders and PVC and HDPE pipes will require additional straight run (contact factory for assistance). Avoid, if possible, installations immediately downstream of bends, fans, nozzles, heaters and especially valves, or anything else installed in the line that may cause nonuniform flow profiles and swirls. Otherwise signal output errors could result, unless significantly more straight run is provided, or in the absence of sufficient straight run, Flow Conditioners (page 13) are installed (contact Sage for assistance if needed). Refer to page 13 to see the benefits of incorporating Flow Conditioners.

Insertion styles are available through Sage Metering, Inc. with a standard 1/2" OD probe support assembly; 3/4" is also available. Standard probe lengths are 6", 12", 15", 18", 24", 30", 36" and 48". A common method of mounting the probe assembly through a pipe wall or duct (if ambient air) is with a compression fitting (STCF05). A Sage valve assembly (SVA05) is useful and highly recommended for pressurized applications or other gases, such as Natural Gas. Flange mounting is optionally available.

Sage insertion style flow meters can be assembled and calibrated for use in virtually any size pipe or duct (as small as 1”). Sage insertion flow meters include a probe assembly that supports the sensing element (a self-heated flow sensor and a temperature/reference sensor); a sensor drive circuit; microprocessor meter board, and transmitter enclosure. The probe assembly must be inserted into the correct position in the process gas flow conduit to allow the gas to flow through the sensor “window” across the sensor element. The “sensing point” or active part of the sensor (0.5” from the end of the probe) should be positioned as per the drawing below and the Installation Depth Chart on page 15.

Installation Depth
The center of the pipe (assuming a well developed turbulent flow profile) is fairly flat, and easy to locate. See “Installation Depth Chart” on next page to determine proper insertion depth.

1. SIP Industrial Meter shown in drawing. Note, probe is not bi-directional.
2. Probe should be inserted per Installation Depth Chart (see following page), so sensors are in the center of the pipe.
3. The portion of the probe that remains outside of the pipe, is simply the factory ordered probe length (i.e. “-15” = 15 inches) minus the “Y” dimension.
INSTALLATION DEPTH CHART
Methods for Probe Insertion to Pipe Center

**METHOD 1**
Using charts below, select pipe size (column 1), determine X. Insert probe until the end touches the bottom of the pipe (ID), mark probe as it exits top of fitting. Lift probe distance “X” and tighten compression fitting.

**METHOD 2**
Using charts below, select pipe size (column 1), determine Y. Subtract Y from the factory supplied probe length. That difference Z (see drawing on page 14) should be outside of the pipe, and is measured from the bottom of the enclosure of the probe weld to pipe OD.

---

1 For other Pipe Schedules, such as Schedule 10, contact Sage, however the Y dimension will be the same for any Schedule Pipe
2 The 1” Pipe Size needs to have the Probe “Bottomed Out” (option “BOT”); the calibration method for the 1 1/2” Pipe is either as shown below, or with option “BOT”
CONFIGURATION FOR UTILIZING FOUR (4) SAGE INSERTION MASS FLOW METERS FOR LARGE ROUND PIPES OR DUCTS LARGER THAN 36” TO MINIMIZE EFFECTS OF VARYING FLOW PROFILES
(It is recommended that Factory be contacted to assist with applications of this nature)

The outputs of the four meters will be averaged by customer’s PLC or other method to improve overall accuracy in measuring the flow rate. (For medium sized round pipes [18” to 36”], two meters, on the opposite side of the same diameter, may be sufficient [insert parallel to an upstream 90 degree bend for optimal benefit.]) Note, in this configuration, each sensor needs to be averaged.
In-Line Flow Meter Application

IN-LINE FLOW METERS

In-line mounting styles are available through Sage Metering, Inc. in sizes from 1/4" pipe through 4" pipe. Threaded male NPT ends are standard up to 2-1/2"; ANSI 150lb flanged ends are recommended for 3" and 4" models. Contact the factory if optional end mounting styles are required. Pipe sizes in excess of 4" require the insertion style mass flow meter.

The in-line style flow meter assembly flow section is typically specified to match the user’s flow conduit and is plumbed directly in the flow line by threading, flanging, welding, etc. DO NOT USE REDUCERS. It includes the sensing element (a self-heated flow sensor and a temperature/reference sensor) mounted directly in the specified flow section for exposure to the process gas; a sensor drive circuit; microprocessor meter board, and transmitter enclosure.

All in-line Flow Meters, 1/2" and up have built-in Flow Conditioners. See Table (page 11) for Upstream Straight run requirements. Note, the 1/4" and 3/8" do not have Flow Conditioners and thus require more straight run.

FLOW CONDITIONING SCREENS FOR IN-LINE FLOW BODIES 1/2" AND UP

LENGTH “L” SAME AS NON-FLANGED METER
(See table on page 35. For example, 1"x8" flow body has an 8" length. The length will be the same whether an NPT flow body, or whether flanged. If a flanged flow body, the 8" dimension will be a Face-to-Face dimension.)

Screens shown with NPT fitting.

1 Note, Flow conditioning is also available for Insertion Meter applications (see page 13)
Prime Integral (Series SIP)

SEE FOLLOWING PAGES FOR TERMINAL HOOKUP
24 VDC Prime Integral Terminals (Series SIP)

(ADAPTED FOR HAZARDOUS SERVICE)

**B4 and B5 Jumper**
Remove jumper for externally sourced 4-20 mA. In this mode, user supplies 9-27 Volts to externally power the 4-20 mA loop, and the 4-20 mA loop becomes optically isolated.

**Note, Flow Meter is supplied with a 10K (1/2 watt) metal film resistor (Resistive Jumper) connected across Terminals C4 and C6. For externally powered operation, in addition to removing B4 & B5 Jumpers, it is necessary to connect C4 Resistive Jumper to Terminal B3 instead of C6. Note, B3 must be connected to the External Sources common in order to enable the optically isolated pulse output. In this mode, Pulse Output will depend on customer source voltage. Use Sage Resistive Jumper only!**

**Note:** The Sage Prime draws 2.4 watts maximum (i.e., 100 mA @ 24VDC)

1 Specify the Sage Prime PLUS option in order to have the Modbus Ground (Terminal C1, COM) isolated from the 24 VDC Power Supply Ground (Terminal B6). All other features of Prime PLUS are identical to the standard Sage Prime, except other voltage available.
2 It is important to connect the Ground when using Modbus communications, or ground loop problems may develop. Improper wiring can also damage internal circuits.
3 Note, if customer externally powers the 4-20 mA by removing the jumper, the Pulse voltage output is also effected: The voltage output of the Pulse will follow the customer power (i.e. 24 VDC external power will result in a 24 VDC Pulse [maximum of 50 mA]; 12 VDC external power will result in a 12 VDC Pulse)
4 Pulse width 250 usec default (adjustable with Addresser software)
5 Using Sage Addresser, a Low Flow Cutoff (LFC), commonly referred to as Min Cutoff or Zero Cutoff can be entered into the FLOW MIN Functions. In Versions 1.82 or higher, the Low Flow Cutoff and the 4-20 mA Scaling are independent of each other. For example, a Low Flow Cutoff (LFC) of 10 SCFM on a Meter with a Full Scale of 100 SCFM will report 0 on the Display and 4 mA on the output. The output will remain at 4 mA until the LFC is exceeded (i.e. 25 SCFM=8 mA). Thus the 4 mA will always be zero based

**Notes:**

1. Specify the Sage Prime PLUS option in order to have the Modbus Ground (Terminal C1, CON) isolated from the 24 VDC Sage Power Supply Ground (Terminal B6). All other features of Prime PLUS are identical to the standard Sage Prime, except other voltage available. (See footnote 8)

2. It is important to connect the Ground when using Modbus communications, or ground loop problems may develop. Improper wiring can also damage internal circuitry.

3. Note, if customer externally powers the 4-20 mA by removing the jumper, the Pulse voltage output is also affected. The voltage output of the Pulse will follow the customer power (i.e. 24 VDC external power will result in a 24 VDC Pulse (maximum of 50 mA), 12 VDC external power will result in a 12 VDC Pulse).

4. Pulse width 250 usec default (adjustable with Addresser software)

5. Using Sage Addresser, a Low Flow Cutoff (LFC), commonly referred to as Min Cutoff or Zero Cutoff can be entered into the FLOW MIN Functions. In Versions 1.82 or higher, the Low Flow Cutoff and the 4-20 mA Scaling are independent of each other. For example: A Low Flow Cutoff (LFC) of 10 SCFM on a Meter with a Full Scale of 100 SCFM will report 0 on the Display and 4 mA on the output. The output will remain at 4 mA until the LFC is exceeded: (ie: 25 SCFM = 8 mA). Thus the 4 mA will always be zero based.

6. This version does not have Hazard Approvals

7. 24 VDC ±10%

8. Other DC voltages (5 VDC, 12 VDC, 48 VDC) available on Prime PLUS. Contact Sage

9. Assumes the 4-20 mA is Externally Powered

10. Modbus Ground becomes isolated from the B6 Power Supply Ground only on Prime PLUS version (specify “PL-US”)

1 Specify the Sage Prime PLUS option in order to have the Modbus Ground (Terminal C1, COM) isolated from the 24VDC Power Supply Ground (Terminal B6). All other features of Prime PLUS are identical to the standard Sage Prime, except other voltage available. (See footnote 8)

2 It is important to connect the Ground when using Modbus communications, or ground loop problems may develop. Improper wiring can also damage internal circuitry.

3 Note, if customer externally powers the 4-20 mA by removing the jumper, the Pulse output voltage is also affected. The voltage output of the Pulse will follow the customer power (i.e. 24VDC external power will result in a 24VDC Pulse (maximum of 50mA); 12VDC external power will result in a 12VDC Pulse)

4 Pulse width 250msec default (adjustable with Addressee software)

5 Using Sage Addresser, a Low Flow Cutoff (LFC), commonly referred to as Min Cutoff or Zero Cutoff can be entered into the FLOW MIN Functions. In Versions 1.82 or higher, the Low Flow Cutoff and the 4-20 mA Scaling are independent of each other. For example: A Low Flow Cutoff (LFC) of 10 SCFM on a Meter with a Full Scale of 100 SCFM will report 0 on the Display and 4mA on the output. The output will remain at 4mA until the LFC is exceeded. (ie: 25 SCFM = 8mA). Thus the 4mA will always be zero based

6 Class I, Div 2 Groups A,B,C,D,T4 and ATEX Ex n IIC T4

7 24 VDC ± 10%

8 Other DC voltages (5VDC, 12VDC, 48VDC) available on Prime PLUS. Contact Sage

9 Assumes the 4-20 mA is Externally Powered

10 Modbus Ground becomes isolated from the B6 Power Supply Ground only on Prime PLUS version (specify "PLUS")
AC Powered Prime Remote Terminals (Series SRP)\(^6\)

**Note:** Flow Meter is supplied with a 10K (1/2 watt) metal film resistor (Resistive Jumper) connected across Terminals C4 and C6. For externally powered operation, in addition to removing B4 & B5 Jumpers, it is necessary to connect C4 Resistive Jumper to Terminal B3 instead of C6. Note, B3 must be connected to the External Sources common in order to enable the optically isolated pulse output. In this mode, Pulse Output is optically isolated. Pulsed Output voltage will depend on customer source voltage. Use Sage Resistive Jumper only!

**Note:** The Sage Prime draws 2.4 watts maximum (i.e., 100mA @24VDC)

---

1. Specify the Sage Prime PLUS option in order to have the Modbus Ground (Terminal C1, COM) isolated from the 24 VDC Sage Power Supply Ground (Terminal B6). All other features of Prime PLUS are identical to the standard Sage Prime, except other voltage available. (See footnote 2)
2. It is important to connect the Ground when using Modbus communications, or ground loop problems may develop. Improper wiring can also damage internal circuitry.
3. Note, if customer externally powers the 4-20 mA by removing the jumper, the Pulse voltage output is also affected. The voltage output of the Pulse will follow the customer power (i.e. 24 VDC external power will result in a 24 VDC Pulse (maximum of 50 mV); 12 VDC external power will result in a 12 VDC Pulse)
4. Pulse width 250 usec default (adjustable with Addresser software)
5. Using Sage Addresser, a Low Flow Cutoff (LFC), commonly referred to as Min Cutoff or Zero Cutoff can be entered into the FLOW MIN Functions. In Versions 1.82 or higher, the Low Flow Cutoff and the 4-20 mA Scaling are independent of each other. For example: A Low Flow Cutoff (LFC) of 10 SCFM on a Meter with a Full Scale of 100 SCFM will report 0 on the Display and 4 mA on the output. The output will remain at 4 mA until the LFC is exceeded (i.e. 25 SCFM-8 mA). Thus the 4 mA will always be zero based
6. This version does not have Hazard Approvals
7. 24 VDC ±10%
8. Other DC voltages (5 VDC, 12 VDC, 48 VDC) available on Prime PLUS. Contact Sage
9. Assumes the 4-20 mA is Externally Powered
10. Modbus Ground becomes isolated from the B6 Power Supply Ground only on Prime PLUS version (specify “PLUS“)
Junction Box Wiring Terminals for Remote Style Meters (Series SRP)
(THERE ARE NO ELECTRONICS INSIDE JUNCTION BOX)

SEE THE PREVIOUS PAGE FOR THE OTHER END OF THE REMOTE WIRING HOOKUP (the electronics side).

NOTE: The Sensor Junction Box will have a serial number tag. It is important to match this serial number with the serial number of the Remote electronics. Mixing components from different meters can result in significant errors.

1 NOTE: There are hidden jumpers (underneath the terminal strip) that short together the Blue and Green wires, and also short together the Black and Orange wires. These extra wires are part of the meter’s Lead Length Compensation circuitry, allowing the user to change the length of the interconnect cable (from 0 to 1000 feet) without affecting the accuracy. 25 feet of cable are initially supplied (for cabling longer than 1000 feet, contact Sage).

2 Sage supplies 25 feet of cable for the interconnect wires between the Junction Box and the Remote Enclosures: Carroll (manufacturer), Part #C0783, 20 gauge, 6 conductor, foil shielded, grey PVC jacket.

CAUTION: Cable and cable glands are not for use in hazardous area environments. Power, ground, outputs, shielded cable, seal fittings and conduits are to be supplied by customer.
Section B

STYLES AND FEATURES
Principle of Operation of the Thermal Mass Flow Meter

Sage Thermal Mass Flow Meters have two sensors constructed of reference grade platinum windings (RTDs). The two RTDs are clad in a protective 316SS sheath and are driven by a proprietary sensor drive circuit. One of the sensors is self-heated (flow sensor), and the other sensor (temperature/reference sensor) measures the gas temperature. The pair is referred to as the sensing element, and is either installed in a probe as an Insertion style, or inserted into a pipe section as an In-Line style flow meter.

As gas flows by the flow sensor, the gas molecules carry heat away from the surface, and the sensor cools down as it loses energy. The sensor drive circuit replenishes the lost energy by heating the flow sensor until it is a constant temperature differential above the reference sensor. The electrical power required to maintain a constant temperature differential is directly proportional to the gas mass flow rate and is linearized to be the output signal of the meter.

It is essential that this constant temperature differential be maintained, even if there are wide fluctuations in gas temperature. It is the “job” of the Sage proprietary sensor drive circuit to maintain the differential, whether or not the gas temperature changes, or however quickly molecules cool off the flow sensor. It is also necessary to properly calibrate the device with the actual gas (or close equivalent with certain gases), in the Sage National Institute of Standards certified (NIST) calibration facility. By accomplishing these two critical objectives, the Sage meters provide an extremely repeatable (0.2% of Full Scale) and accurate output directly proportional to the mass flow rate of the gas being measured.
Features and Benefits

SAGE PRIME™ THERMAL MASS FLOW METER FOR GASES
Sage Prime is the top selling meter in our Product Line. The Sage Prime Thermal Mass Flow Meter features a bright, high contrast, photo-emissive OLED display of Flow Rate, Total and Temperature in a robust, yet lightweight, dual-compartment industrial enclosure. The flow rate is also displayed graphically in a horizontal bar graph format. The rear compartment is completely separated from the electronics, and has large, easy-to-access, well marked terminals, for ease of customer wiring (see photo below). It is powered by 24 VDC (12 VDC optional, or 115/230 VAC). The power dissipation is under 2.5 watts (e.g. under 100 ma at 24 VDC).

The Sage Prime Flow Meter is offered in Integral or Remote Style (which has lead-length compensation up to 1000 feet as well as an Explosion Proof Junction Box). Specify any standard probe length or flow body size. It has a 4-20 ma output as well as a Pulsed Output of Totalized Flow (solid state transistor drive). In addition, Sage Prime supports full Modbus® compliant RS485 RTU communications (IEEE 32 Bit Floating Point).

Sage Prime is CE approved, and CSA and UL approved for Hazardous Service1 (see Approvals tab on the website).

CONTINUOUS DIAGNOSTICS & FIELD CONFIGURABILITY
Sage Prime has continuous diagnostics. The raw calibration milliwatts (mw) is always displayed in the upper left hand corner of the meter’s display. At any time, you can check this reading at a “no flow” condition, and compare the reading to the original reported “zero flow” value noted on the last few lines of your meter’s Certificate of Conformance or the flow meter’s data tag. This in-situ diagnostic procedure not only checks the sensor performance and the “live zero” calibration point, but it also verifies that the sensor is clean. It essentially provides a means to validate that the meter is operating properly, verifies that there is no shift or drift, and eliminates the need for annual factory calibrations. This simple field diagnostic procedure, in addition, verifies that the sensor is free from contamination, even without inspection.

Although Sage Prime is fully configured upon shipment, for the pipe and process conditions requested, there are three strategies if changes are needed: Sage DONGLE; the Sage ADDRESSER software program; or the Sage ADDRESSER advanced program. Contact Sage for details.

MAJOR BENEFITS OF THERMAL MASS FLOW METERS
- Direct Mass Flow – No need for separate temperature or pressure transmitters
- High Accuracy and Repeatability – Precision measurement and extraordinary repeatability
- Turndown of 100 to 1 and resolution as much as 1000 to 1
- Low-End Sensitivity – Measures as low as 5 SPM (e.g., 1 SCFM in a 6” pipe)
- Negligible Pressure Drop – Will not impede the flow or waste energy
- No Moving Parts – Eliminates costly bearing replacements, and prevents undetected accuracy shifts
- Dirt Insensitive – Provides sustained performance
- Low cost-of-ownership
- Ease of installation and convenient mounting hardware

SPECIFIC BENEFITS OF THE SAGE PRIME
- High contrast photo-emissive OLED display with numerical Flow Rate, Total and Temperature, as well as Graphical Flow Indicator
- Photocell activated Screen Saver to extend display life
- Calibration milliwatts (mw) is continuously displayed, providing for ongoing diagnostics, and in-situ calibration check
- Modbus® compliant RS485 RTU communications
- Isolated 4-20 ma output
- Rugged, user-friendly packaging with easy terminal access
- Option for Solar Energy use (12VDC models)
- Low power dissipation, under 2.5 Watts (e.g. under 100 ma at 24 VDC)
- Powerful state-of-the-art microprocessor technology for high performance mass flow measurement and low cost-of-ownership
- Proprietary digital sensor drive circuit provides enhanced signal stability and unaffected by process temperature & pressure changes
- Remote Style has Lead-Length Compensation. Allows remote electronics up to 1000 feet from probe; Explosion Proof Junction Box has no circuitry, just terminals
- Field reconfigurability via Sage ADDRESSER or Sage DONGLE
- Flow conditioning built into In-Line flow meters (1/2” and up)
- Captive Flow Conditioners for Insertion Meter applications, if required

---

1 Note, a built-in photocell continuously monitors the ambient light, and adjusts the display brightness for optimum long-term life, and also senses motion which automatically switches display from Screen Saver mode to Normal mode

2 Only available with 24VDC powered meters
Sage Metering is your source for monitoring, measuring and controlling the gas mass flow in your industrial process, building management system or environmental application. Our high performance, NIST Traceable, Thermal Mass Flow Meters will help increase productivity, reduce energy costs, maximize product yields, and/or help reduce environmental insult. Sage provides high quality In-Line and Insertion Thermal Mass Flow Meters for a wide variety of industrial, commercial, and environmental monitoring needs, including carbon credit verification for Greenhouse Gas reduction.

**SAGE PRIME™ Styles and Specifications**

Our experienced application engineers, many of whom have worked in the Thermal Mass Flow marketplace since its inception, will assist you in choosing the proper gas Flow Meter for your application — and they will be pleased to offer installation guidance to assure that the meter(s) selected will perform as accurately as possible. Additionally, our Service Staff stand ready to support you with any after-sale assistance that you may require.

**SIP SERIES – INTEGRAL**

*Flow Element is In-Line Style consisting of a choice of 316 Stainless Steel Schedule 40 Flow Bodies sized from 1/4" x 6" long to 4" x 12" long.*

*Flow Element is Insertion Style, consisting of a 1/2" OD probe (3/4" optional) with lengths up to 36" long (typically 15" long) suitable for insertion into the center of a process pipe.*

**SRP SERIES – REMOTE**

The electronics has an isolated 4 to 20 mA output proportional to Mass Flow Rate as well as pulsed outputs of Totalized Flow (24 VDC solid state transistor drive). In addition, Modbus RS485 RTU communications is standard (IEEE 32 Bit Floating Pt).

**INTEGRAL STYLE ELECTRONICS**

Electronics is Integral Style, with rugged windowed dual compartment enclosure with local display. The display is a high contrast photo-emissive OLED display with Screen Saver, and it displays Mass Flow Rate, Totalized Flow and Temperature as well as a graphical representation of Flow Rate in a horizontal bar graph format. In addition, the calibration milliwatts (mW) is continuously displayed, providing ongoing diagnostics.

**REMOTE STYLE ELECTRONICS**

Electronics is Remote Style, with rugged windowed dual compartment enclosure with display. The display is a high contrast photo-emissive OLED display with Screen Saver, and it displays Mass Flow Rate, Totalized Flow and Temperature as well as a graphical representation of Flow Rate in a horizontal bar graph format. In addition, the calibration milliwatts (mW) is continuously displayed, providing ongoing diagnostics.

**PRIME SIP/SRP**

Accuracy is +/– 0.5% of Full Scale +/– 1% of reading with a turn-down of 100 to 1 and resolution as much as 1000 to 1. Repeatability is 0.2%. The Flow Meter is Sage Metering, Inc. PRIME Series, with the trade name Sage Prime™.

**ENGINEERING SPECIFICATIONS OF OPTIONAL SAGE PRIME PLUS**

This is an optional version of Sage Prime offering a separate ground for the 24VDC Power Supply (optional 5 VDC or 12 VDC Power Supplies) which isolates the Modbus ground from the power supply ground. All other features of Prime PLUS are identical to the standard Sage Prime, except Approvals do not apply at this time.

1. Male NPT ends are standard, with flanged ends, tube, or butt weld Optionally available
2. Mounting hardware such as Isolation Valve Assemblies, Compression Fittings, and Flanges, are optional
3. Chart of Flow Body lengths is on page 10 of the “Sage Gas Flow Meters” brochure (see “In-Line Flow Meters”)
4. Enhanced accuracy available upon request, especially if turn-down limited. Contact Sage
Sage PRIME Organic (OLED) Display

1. Raw Calibration milliwatts (mw) for Diagnostics and Periodic “Zero Flow” Calibration Check
2. Graphical Indication of Percentage of Full Scale Flow Rate
3. Flow Rate
4. Totalized Flow (Consumption) (Value is Retained during Power Outage or Power Cycling)
5. Flashes with each pulsed output of consumption
6. Engineering Units of Flow Rate (the last digit can be S(seconds), M(minute), H(hour)
7. Engineering Units of Consumption
8. Photocell activated Screen Saver extends display life

1 Upon start-up, the Revision No., Serial No., and Modbus ID will display for a few seconds. Also, the output configurations symbol is momentarily displayed.
2. Note, a built-in photocell continuously monitors the ambient light, and adjusts the display brightness for optimum long-term life, and also senses motion which automatically switches display from Screen Saver mode to Normal mode.
3. To view display, wave hand over display or use a flashlight. The Flow Meter displays for one minute, then the Screen Saver resumes.

**Approvals**

**HAZARDOUS LOCATION APPROVALS**

All 24 VDC Powered Sage Prime Meters (SIP Integral Insertion, SIP In-Line, SRP Remote Insertion, SRP Remote In-Line) are approved for Class 1, Div 2, Groups A, B, C, D, T4 and ATEX: Ex nA IIC T4. AC Powered Meters are not approved.

Testing is in accordance with the following Safety Standards:

The following is required to comply with the above mentioned Approvals

1) Repair of the product (or replacement of components) is not possible by the user

2) As noted on the following label (see below) it will contain the following markings: Ex symbol, nA symbol IIC, temperature class

3) All Prime DC meters will be marked with “X” which means that these Special Conditions of Use will apply:
   a) The completed meter must be installed with a rigid or flexible metal conduit in order to satisfy approval conditions.
   b) The meter has been approved for use with the electronics enclosure in an ambient temperature from -20°C < Ta < 65°C.

4) Sage Metering considers a linear correction suitable for temperatures exceeding the temp code rating of 40°C (104°F) thus no customer correction is needed.

**CONFORMANCE**

All AC & DC Powered Sage Metering, Inc. Series SIP (Sage Prime-Integral) and Series SRP (Sage Prime-Remote) are CE Compliant for the following CE directives:

- EN61000-6-4 for Electromagnetic compatibility;
- EN61000-3-2 for Harmonics;
- EN61000-3-3 for Flicker;
- EN61000-6-2 for Electromagnetic Compatibility (Immunity for Industrial Environments), which includes EN61000-4-2 for ESD;
- EN61000-4-3 for Radiated Immunity;
- EN61000-4-4 for EFT/B; EN61000-4-5 for Surge;
- EN61000 for Conducted Immunity;
- EN61000-4-8 for Magnetic Immunity;
- EN61000-4-11 for Voltage Interruptions

**MEDICAL CONFORMANCE**

Contact Sage Metering if Medical CE Conformance is required. (AC Powered Sage Prime Meters only.) The Standard is to IEC 60601-1-2:2007 Edition 3
SIP Series Integral Style Mass Flow Meters

**IN-LINE STYLE**¹,³

150#, 300#, or 600# flanged ends are optionally available. (150# flanges recommended on 3” and 4” Flow Bodies)

**CAUTION:**
Do not rotate the Enclosure of In-Line Style Meters relative to the Flow Tube, or the calibration may be effected since the sensors may become misaligned.

**IN-LINE METER DIMENSIONS**

MOUNTING OPTIONS
1. Overhead with U-bolts (customer supplied) across pipe on each leg
2. Vertically, as shown
3. Horizontally

- 1/2" NPT User Entry for Wiring (2)
- CORD GRIP or NPT PLUG (as req’d) BOTH SIDES
- 3/4" NPT for Remote Cable
- .266 Dia HOLES
- 1/2" NPT User Entry for Wiring (2)
Mounting Hardware

SVA05 SERIES ISOLATION VALVE ASSEMBLY FOR INSERTION METERS
(for Low Pressure SVA05 see page 39)

Used for pressures to 650 psig (shown for use with 1/2" diameter insertion meters). 150# or 300# flanged mounting is optionally available. Available sizes are 1/2" x 3/4" NPT (SVA05 shown), and 3/4" x 1" NPT for use with 3/4" diameter insertion meters (SVA07).

NOTE: User needs to weld a 3/4" female threadolet (of appropriate radius) to mate with existing pipe after a 3/4" hole has been drilled in pipe. The 3/4" Male Coupling of the Sage Isolation Valve Assembly will thread into the user’s 3/4" threadolet.

STCF SERIES TEFION FERRULE COMPRESSION FITTING

1/2" tube x 1/2" pipe fitting (shown, not to scale), is used for low pressure insertion applications to 125 psig (Stainless Steel Ferrule optional for higher pressure applications – up to 225 psig). Also available in 3/4" tube x 3/4" pipe size.

SAFETY CHAIN LENGTH

- 12" = 8.25"
- 15" = 11.25"
- 18" = 14.25"
- 24" = 20.25"

1/2" BORE SINGLE PIECE COLLAR CLAMPS

1/2"-3/4" BALL VALVE WELDMENT WITH 1/2" TUBE TO PIPE COMPRESSION FITTING

3/4" x 1.5" PIPE NIPPLES

3/4" x 3" BALL VALVE

3/4" x 1" HALF COUPLING (THREADOLET)

Mounting Plate for Thin Walled Ducts (includes STCF05 Compression Fitting)
SVA05LP Low Pressure Isolation Valve Assembly

NOTES AND CAUTIONS

- Suitable for low pressure Air or Natural Gas applications (maximum 50 PSIG)
- Assumes 1/16” Insertion Probe inserted to center of a Pipe (see Sage Probe Insertion Guidelines)
- Teflon Ferrule permits ease of Probe insertion or removal
- Exercise caution when loosening Ferrule nut during insertion and removal of Probe, since this model has no Safety Chain
- Note, maximum upward force is 20% of pipe pressure (i.e., 10 Lbs with 50 PSIG)
- The Assembly will be shipped with a plastic sleeve that protects the 3/4” pipe nipple
- It is the Customer’s responsibility to weld a Female Threadolet with correct diameter to pipe
Flanged Ends for In-Line Meter (OPTIONAL)

Flanged Mounting for Insertion Meter (OPTIONAL)

Flanges for 3½" pipe sizes and up, have 8 bolt holes

Flanges for 3" pipe sizes and smaller have 4 bolt holes
Section D

DIAGNOSTICS
Common Diagnostics

**SYMPTOM:** Display failure, or pixels extremely dim.
**CORRECTIVE ACTION:** Contact Factory. Certain types of failures are under long term warranty. Please note that the 4-20 mA will still function normally.

**SYMPTOM:** Display fading, or partially fading.
**CORRECTIVE ACTION:**
  a) Some fading, particularly with those characters that are lit up most frequently, is normal. The flow meter will continue to function properly, and flow meter accuracy and outputs will not be effected.
  b) In extreme cases, contact the factory for display replacement.
  c) Note, in late 2009, the Sage Prime was modified to incorporate a built-in photocell. The purpose of the photocell is to adjust the display brightness with ambient lighting. The brighter the surrounding lighting conditions, the brighter the display. Lower ambient lighting conditions, such as a factory environment, will dim the display. The display will be dimmest if operated in low ambient lighting, or at night. The photocell circuit is designed to extend the life of the display, and to minimize fading.
  d) Note, in early 2010, a further enhancement was added to further extend the life of the display. The above mentioned built-in photocell also senses motion which automatically switches display from Screen Saver mode to Normal mode.

**SYMPTOM:** Erratic Readings.
**POSSIBLE CAUSE:** If a large Motor or Generator or Variable Frequency Drive (VFD) is nearby the enclosure, it may be inducing sufficient analog noise into the circuitry to temporarily corrupt the data.
**SUGGESTED CORRECTIVE ACTION:**
  a) If a Power-Restart temporarily solves the problem, than it is likely that the source of the noise was the problem.
  b) To prevent subsequent problems, if a Remote Style Meter, move the enclosure as far away as possible from the source (the Motor or VFD).
  c) If an Integral Style Meter, mount the meter in a different location (further from the source) or move the source further from the meter.

**SYMPTOM:** Erratic Readings on a Remote Meter.
**POSSIBLE CAUSE:** In some cases, analog noise is induced into the Remote cable causing erratic, or climbing readings.
**SUGGESTED CORRECTIVE ACTION:**
  a) Be sure the remote cable is installed in metal conduit and grounded on one end (in some cases, grounding both ends may be required).
  b) Also, avoid coiled cable, especially if not in metal conduit.
  c) Also, if extra cable exists, move the extra cable as far away as possible from any source of analog noise, such as large motors or VFDs.

**SYMPTOM:** Meter reading zero continuously, or Full Scale continuously, or temperature reading is abnormally low (hundreds of degrees below zero).
**POSSIBLE CAUSES/SUGGESTED CORRECTIVE ACTION:**
  a) It is likely that a wire is loose. But in rare cases, a sensor could fail (i.e., if a standard sensor, HT01 or HT02 sensor exceeds a process temperature of 450˚F.)

  b) Check for continuity to be sure the wiring is making good contact at the terminals of the Junction Box.

  c) Also, to verify that the electronics and the sensor serial number are the same, note the following: The sensor's serial number will come up upon power up, right after Initializing on the Display. If the serial number doesn't agree with the Junction Box labels, that would affect calibration (in other words, sensors and electronics are a matched pair—mixing them up will cause false readings). Also metal Serial Number Tags are fastened to both the electronics and the Junction Box. They must have identical Serial numbers.

  d) To check if a sensor has failed on a remote style meter, it is easy to use the Junction Box to do so. You must Power Down (shut off power), but you do not need to remove the probe from the pipe. Refer to page 24.
e) An Ohm Meter is required to check across the sensor leads of the Flow Sensor. Look at the drawing of the Junction Box. Disconnect the red wires on the Factory Side to isolate and measure the resistance. If the reading is infinity or a short, it means that sensor has failed.

f) Now check the Temperature Sensor. Disconnect the white wires on the Factory Side to isolate and measure the resistance. If you have infinity or a short, it means that sensor is burned out. Note: Normally the sensors will read approximately 110 ohms at 70° F. At higher temperatures they should read a higher resistance, but both sensors should have a similar value.

g) On integral style meters (SIP), there is no Junction Box. In that case, refer to the Prime Integral Terminals on page 19 and check the sensor wires. Remove the appropriate wires first (red pair for flow, then white pair for temperature). Measure their resistance. If reading infinity or short, it means that sensor has failed.

**SYMPTOM:** Meter Railing (Pegging) or Reading High

**POSSIBLE CAUSES/SUGGESTED CORRECTIVE ACTION:**

a) Insufficient straight run (i.e. flow profile is disturbed, causing errors).

b) Possible jet effect if upstream pipe is smaller than meter flow body or if valve is too close upstream to meter.

c) Not following Probe Insertion Guideline.

d) If sensor is inserted in reverse (“Upstream” mark is facing downstream) Meter may over-report (or under-report) by as much as 30%.

e) If sensor is not aligned properly, with “Upstream” mark facing upstream, a rotation greater than ± 5 degrees may cause change in reading (greater than ± 5 degrees and less than ± 20 degrees causes meter to over-report; a greater rotation actually blocks the sensor, and causes meter to under-report).

f) A downstream valve too close to the meter (flow may be reflecting back).

g) Possibly caused by water droplets condensing out of gas stream (which generally causes output to spike; but if droplets are near continuous, output may rail).

h) Meter is miswired, especially in Remote Style application.

i) Possibly caused by water droplets condensing on inside of pipe wall, which roll down or hit sensor causing output to spike; but if droplets are near continuous, output may rail. Note: Recommend installation 45° from vertical (see drawing on page 68).

j) Possibly caused by water droplets condensing out of gas stream and filling the cavity containing the sensing elements (usually due to probes mounted below horizontal in saturated pipes).

k) Sensor may be contaminated. Remove probe, wipe off or clean with a solvent. Reinsert.

l) Using a different gas or gas mix than the meter was specified and calibrated for.

m) If a Remote Style Meter (SRP), be sure Serial Numbers of Junction Box and Remote Electronics are identical (if not, errors in calibration are inevitable). To confirm, verify that Junction Box Serial Number Tag has identical Serial Numbers to Tag on Remote Enclosure.

n) Meter may appear to be reading high if user is comparing Sage flow meter readings (SCFM) to an uncorrected volumetric device (ACFM). For example, at constant volume, a decrease in gas temperature will increase the mass flow (SCFM). That is completely normal.

**SYMPTOM:** Reading Low

**POSSIBLE CAUSES:**

a) Insufficient straight run (i.e. flow profile is disturbed, causing errors).

b) Poor flow profile Upstream (insufficient upstream straight run).

c) Not following Probe Insertion Guideline.

d) If sensor is inserted in reverse (“Upstream” mark is facing downstream) Meter may over-report (or under-report) by as much as 30%.

e) If sensor is not aligned properly, with “Upstream” mark facing upstream, a rotation greater than ± 5 degrees may cause change in reading (greater than ± 5 degrees and less than ± 20 degrees causes meter to over-report; a greater rotation actually blocks the sensor, and causes meter to under-report).
f) Sensor may be contaminated. Remove probe, wipe off or clean with a solvent. Reinsert.

g) Using a different gas or gas mix than the meter was specified and calibrated for.

h) If a Remote Style Meter (SRP), be sure Serial Numbers of Junction Box and Remote Electronics are identical (if not, errors in calibration are inevitable). To confirm, verify that Junction Box Serial Number Tag has identical Serial Numbers to Tag on Remote Enclosure.

i) Meter may appear to be reading low if user is comparing Sage flow meter readings (SCFM) to an uncorrected volumetric device (ACFM). For example, at constant volume, an increase in gas temperature will lower the mass flow (SCFM). That is completely normal.

j) On most models, the Totalizer will not start counting for 10 seconds after power up so any flow data will not be accumulated during this time.

k) Insufficient power supply—most products require minimum 100 ma.

l) Excessive load on the 4-20 ma. (To check if problem is due to 4-20 ma output device, temporarily remove device, and observe if display reads as expected).

**SYMPTOM:** Totalizer can take up to 10 seconds to update its reading when flow meter is first powered up, or a channel is changed.

**CORRECTIVE ACTION:** None. This slight delay is completely normal.

**SYMPTOM:** Display does not have power

**POSSIBLE CAUSE:** Mis-wiring

**SYMPTOM:** 4-20 mA output not tracking the flow rate display

**POSSIBLE CAUSE:**

a) In normal operation (Self Powered) B4 and B5 must be jumpered to supply power to loop. See pages 19 and 22.

b) In Externally Powered mode, the jumper must be removed. Verify that 9 to 27 Volts DC is supplied to externally power the loop as per page 19 or 22.
In-Situ Calibration Check

RECOMMENDED ON A QUARTERLY BASIS FOR EPA 40 CFR 98 PERIODIC
CALIBRATION VERIFICATION, CAR1 PROTOCOLS, AND CDM2 PROTOCOLS

Sage Prime has continuous diagnostics. The raw calibration milliwatts (mW) is always displayed in the upper left hand corner of the meter’s display allowing the user to conduct an “in-situ” calibration. At any time, you can check this reading at a “no flow” condition and compare the reading to the original reported “zero flow” value noted on the last few lines of your meter’s Certificate of Conformance or the flow meter’s data tag. This diagnostic procedure not only checks the sensor performance and the “live zero” calibration point, but it verifies that the sensor is clean. It essentially provides a means to validate that the meter is operating properly, verifies that there is no shift or drift, and eliminates the need for annual factory calibrations. This simple field diagnostic procedure also verifies that the sensor is free from contamination, even without inspection.

1. Verify that meter has no gas flow
   Close appropriate valves in the process to have a “no flow” condition so you can check the “live zero” mW output of the actual gas (it should be checked at the same pressure as noted on Certificate of Conformance).

   If it is not possible to close valves in the process (e.g. natural gas supply must be kept flowing), a user with a Sage SVA05 or SVA07 Isolation Valve Assembly can check “zero” of the actual gas and pressure without shutting off the gas supply. Refer to SVA SERIES ISOLATION VALVE ASSEMBLY DETAILS ON PAGE 38.
   a) Loosen lower Collar Clamp completely
   b) Slightly loosen compression fitting until Probe can be lifted
   c) Lift Probe until Safety Chain is taut
   d) Tighten compression fitting
   e) Close Valve
   f) Check zero mW as per “2” below

   Optionally, do an ambient air check by removing probe and covering up sensor by capping the sensor with a plastic bag, empty plastic water bottle or other means of preventing flow (see 8).

2. Observe the raw mW on the top of the meter’s display. After one to three minutes of “no flow” stabilization, check the observed reading against the flow meter’s data tag or last line(s) of your Meter’s Certificate of Conformance.

3. A value within 5 milliwatts of the original Factory value (assuming the same gas is checked at same pressure) indicates that meter is still in calibration.

4. A value greater than 5 mW, but less than or equal to 10 mW, also indicates that the meter is still in calibration, but this reading may have been influenced by one or more of the following factors: gas composition, pressure, dirt, non-zero conditions, and sensor orientation. Any of these factors can have an effect on mWo. It is a very sensitive data point; that is why it is such a good check.

5. Note, if all of the above factors were remedied, it would be expected that the mW zero would report less than or equal to 5 milliwatts.

6. Note, in some cases, contamination of the sensor is the only cause of the additional heat transfer during the “no flow” test. Remove probe, and clean the sensor (use an appropriate non-corrosive solvent to remove build up). A soft brush can be used to gently clean the sensing surface, using caution to avoid damaging the sensor elements (the RTD’s).

7. In summary, if a technician in the field were able to simulate Sage calibration conditions, he too would find that the mWo would be within one mW or very close to that. Since this is not always possible, we are finding that after considering all of the field variables, a mWo in the field that is within 10 mW is an acceptable value (see 9). This would allow for a check to be done in the pipe under application conditions.

8. Note, if desired, a second check can be conducted as well but using ambient air: This validation method requires that the sensor be removed from the pipe and inserted in a container such as an empty plastic water bottle.

9. For CAR compliance Sage recommends a quarterly In-Situ Calibration Check for the following Protocols: U.S. Landfill Protocol, Version 4.0, Par. 6.2
   Mexico Landfill Protocol, Version 1.1, Par. 6.2
   U.S. Livestock Protocol, Version 3.0, Par. 6.2
   U.S. Livestock Protocol, Version 4.0, Par. 6.3
   Mexico Livestock Protocol, Version 2.0, Par. 6.2

   As per the protocols, the maximum allowable drift is 5%. Percent drift can be determined by multiplying the mW change from factory value (see 2) by 1.0% (i.e. each mW change equals 1% drift).

1. CAR is the Climate Action Reserve. The Climate Action Reserve is a national offsets program working to ensure integrity, transparency and financial value in the U.S. carbon market. It does this by establishing regulatory-quality standards for the development, quantification and verification of greenhouse gas (GHG) emissions reduction projects in North America. The Climate Action Reserve operates alongside its sister program, the California Climate Action Registry (California Registry), which was created by the State of California in 2001 to address climate change through voluntary calculation and public reporting of emissions.

2. CDI Methodologies (ACM 001): "Methodological tool to determine the mass flow of a greenhouse gas in gaseous stream" (EB-1 Report, Annex 11, Page 1).

3. Sage “zeros” the meter in a horizontal pipe. If you have a vertical pipe, mW will be slightly lower at zero (also see note 4).

4. The allen wrench to loosen collar clamp is ¼” on the SVA05 (it is ⅛” on the SVA07).
Section E

WARRANTIES AND SERVICE WORK
Warranties and Service Work

LIMITED WARRANTY

Sage Metering’s products are warranted against faulty materials or workmanship for one year from the date of shipment from the factory. Sage’s obligation is limited to repair, or at its sole option, replacement of products and components which, upon verification by Sage at our factory in Monterey, California, prove to be defective. Sage shall not be liable for installation charges, for expenses of Buyer for repairs or replacement, for damages from delay or loss of use, or other indirect or consequential damages of any kind. This warranty is extended only to Sage products properly used and properly installed for the particular application for which intended and quoted; and does not cover water damage due to improper use of cord grips or removal of protective caps; and does not cover Sage products which have been altered without Sage authorization or which have been subjected to unusual physical or electrical stress. Sage makes no other warranty, express or implied, and assumes no liability that goods sold to any purchaser are fit for any particular purpose. Transportation charges for materials shipped to the factory for warranty repair are to be paid by the shipper. Sage will return items repaired or replaced under warranty, prepaid. NOTE: No items will be returned for warranty repair without prior written authorization from Sage Metering, Inc. Sage does not warranty damage due to corrosion.

GENERAL TERMS AND CONDITIONS

Detailed General Terms and Conditions can be found on the Sage website (www.sagemetering.com) on a link “General Terms” on the Footer of any page on the website.

CANCELATION / RETURN POLICY

Cancellation or Return: After issuance of a purchase order (by phone, mail, e-mail or fax) or a credit card order (by phone, mail, e-mail or fax), there will be a cancellation fee for any cancelled order. Cancellations must be in writing (by mail, e-mail or fax):

1) If credit card order or non-credit card order is cancelled within 7 days of issuance of purchase order or date order was placed (which ever is earlier), there will be a 10% cancellation fee.

2) If credit card order or non-credit card order is cancelled after 7 days, but prior to shipment, there will be a 20% cancellation fee. (If order is cancelled due to late delivery, the cancellation fee will be waived. Late delivery is defined as shipping a meter 7 days or later than the delivery date acknowledged by Sage Metering at time of placing order).

3) If a credit card customer decides to return the equipment after shipment for credit, credit will not be issued if equipment is damaged or if equipment is returned after four (4) months of shipment. If equipment is not damaged, then equipment can be returned after issuance of a Return Meter Authorization (RMA) by Sage. Returned package must be insured by customer and must reference proper RMA# on outside of package, or package may be rejected (i.e., package will be returned unopened). Credit Card customers will be charged a 30% re-stocking fee (70% balance will be credited back). Customer is responsible for return shipping charges and any damage if improperly packaged.

continued on next page
4) If a non-credit card customer decides to return the equipment after shipment for credit, credit will not be issued if equipment is damaged or if equipment is returned after 1 month of shipment, unless authorized by a representative at Sage Metering, Inc. The Sage representative will issue a Return Material Authorization (RMA) at that time and will advise of the restocking fee. Returned package must be insured by customer and must reference proper RMA# on outside of package, or package may be rejected (i.e., package will be returned unopened). Customer is responsible for return shipping charges and any damage if improperly packaged.
RETURNING YOUR SAGE METER

A Return Material Authorization Number (RMA#) must be obtained prior to returning any equipment to Sage Metering for any reason. RMA#s may be obtained by calling Sage Metering at 866-677-7243 or 831-242-2030 between 8:00 am and 5:00 pm Monday through Friday.

A Sage RMA Form (see page 52) must be filled out and included with the meter being returned to Sage Metering. RMA Form is also accessible by clicking the “Contact” tab of the Sage website (www.sagemetering.com).

Take special care when packaging your meter for return to the factory. The sensor in particular may easily be damaged if not prevented from shifting around within the package and if the sensor itself is not covered to keep it from contacting other package contents. Any damage resulting from improper packaging is the responsibility of the shipper.

A purchase order is required prior to an RMA being issued. Most repairs or recalibrations can be quoted over the phone. For equipment that must be evaluated, an Evaluation purchase order in the amount of $150 is required. Once an evaluation is completed and a quote has been issued, you can choose to proceed with the work or have the unit returned with only the evaluation and freight fee billed.

In accordance with the “Right to Know Act” and applicable US Department of Transportation (DOT) regulations, Sage Metering will not accept delivery of equipment that has been contaminated without written evidence of decontamination, and has instituted the following Return/Repair conditions. Strict adherence to these conditions is required. Returned equipment that does not conform to the requirements listed below will not be processed. If Sage Metering finds evidence of contamination, we may, at our option, have the unit returned at your expense. For your reference, the requirements for packaging and labeling hazardous substances are listed in DOT regulations 49 CFR 172, 178, and 179.

1. The equipment must be completely cleaned and decontaminated prior to shipment to Sage Metering. This decontamination includes the sensor, probe, electronics and enclosures internally and externally. All packaging must be clean and free from contamination.

2. A Material Safety Data Sheet (MSDS) is required for all process fluids and gases that have been in contact with the equipment. This includes fluids or gases used in cleaning the equipment. A Decontamination Statement is also required for each meter returned using a different gas or fluid. Both the MSDS and the Decontamination Statement are to be attached to the OUTSIDE of the shipping container. If both documents are not attached, you will be called, and the equipment sent back to you at your expense.

3. The decontamination Statement must include the following required information

   A. A list of all chemicals and process fluids used in the equipment, including decontamination fluids or gases.

   B. The model and serial number of the equipment being returned.

   C. A company officer or other authorized person’s signature on the statement.

*Scaled INT32 register contents form INT32 values by multiplying the IEEE FLOAT x 1000 ex. FLOAT -> 112.768 > Scaled INT32 -> 112768
Sage Metering Modbus Protocol Rev. 1.80–Rev. 2.07

Sage Prime Meters support communication with other devices via MODBUS® protocol using RTU transmission mode. The Modbus protocol defines a message structure that controllers will recognize and use, regardless of the type of networks over which they communicate. It establishes a common format for the layout and contents of message fields. Transactions use a master-slave technique, in which only one device (the master) can initiate transactions (called queries). The other devices (the slaves) respond by supplying the requested data to the master and by taking the action requested in the query. Sage Meters operate as slaves to other Modbus devices and default to 19200-8-E-1, however, the following modes may also be software selectable:

- 9600-8-N-1  (Baud-Bits-Parity-Stop)
- 9600-8-E-1
- 9600-8-O-1
- 19200-8-N-1
- 19200-8-E-1  (Default)
- 19200-8-O-1

ADDRESS FIELD
The address field contains one byte. Sage Prime Meters will transmit response packets to addresses which are between 1 to 240 decimal (inclusive). Modbus packet writes may be sent to broadcast address 00, however the Prime will not reply with a response packet.

FUNCTION CODE FIELD
The function code field contains one byte. See the section titled Function Codes Supported by Sage Prime.

DATA FIELD
The data field contains four or more bytes. This information is used by the Meter to take the action defined by the function code, or to read or write data to one or many registers.

CRC FIELD
The CRC-16 (cyclical redundancy check) field is two bytes, containing a 16-bit binary value. The CRC value is calculated by the transmitting device, which appends the CRC to the message. The receiving device recalculates a CRC during receipt of the message, and compares the calculated value to the actual value it received in the CRC field. If the two values are not equal, the message will be discarded.

1 Parity on the Wireless Devices manufactured by Obvius is “None” rather than “Even”. The Sage default is 19200-8-E-1. Change to 19200-8-N-1 for the Obvius Modhoppers and related wireless devices.
Function Codes Supported by SAGE Prime

03 (0X03) READ HOLDING REGISTERS

Identical operation as code 04 READ INPUT REGISTERS described below, except READ only.

04 (0X04) READ INPUT REGISTERS

Reads the binary contents of the specified register. This is READ/WRITE register. Sage Prime values are typically 32 bits wide (4 bytes) and contain a single IEEE754 floating point value. Modbus registers are 16 bits wide (2 bytes) so a minimum of 2 Modbus registers are required to transfer all floating point bits to the master. See section titled Sage Floating Point Format.

Query

The query message specifies the starting register address and the quantity of registers to be read.

0x03 READ MULTIPLE HOLDING REGISTERS or
0x04 READ MULTIPLE INPUT REGISTERS

---QUERY---
SA – SLAVE ADDRESS
04 – FUNC CODE
RH – REG ADDR HI
RL – REG ADDR LO
00 – # OF REGS HI
CT – # OF REGS LO
CH – CRC MSB
CL – CRC LSB
---RESPONSE---
SA
04
BC – # of data bytes to follow
DATA0
DATA1
DATAn
CH CRC MSB
CL CRC LSB

REG ADDR HI (RH) is set to:
01 for INTEGER access of integral values
02 for IEEE754 floating point
03 for Scaled (x1000) long integer of floating point value

REG ADDR LO (RL) is the starting address index into the register structure. See section titled Sage Register Index Values.

CT is the register count needed to transfer data. Typically this byte is set to 02 to request 1 full IEEE754 floating point value. (Modbus single registers are 16 bits wide, Sage floating point values are 32 bits wide.)

DATA0-DATAn are bytes in binary format returned from the slave device representing the contents of the selected register(s).

NOTE: values indicated with Ox prefix are in hexadecimal, otherwise in decimal notation.
16 (0x10) WRITE REGISTERS

Wrie the binary contents of the specified register into the meter. Sage Prime values are typically 32 bits wide (4 bytes) and contain a single IEEE754 floating point value. Modbus registers are 16 bits wide (2 bytes) so a minimum of 2 Modbus registers are required to transfer all floating point bits into the meter. See section titled Sage Floating Point Format.

Query

The query message specifies the starting register address and the quantity of registers to be written.

16 (0x10) WRITE MULTIPLE REGISTERS

- 02 for IEEE754 floating point
- 03 for Scaled (x1000) long integer of floating point value

REG ADDR LO (RL) is the starting address index into the register structure. See section titled Sage Register Index Values.

CT is the register count needed to transfer data. Typically this byte is set to 02 to request 1 full IEEE754 floating point value.

BC is the actual number of bytes that follow.

DATA0-DATAn are bytes in binary format transmitted to the slave device representing the contents of the selected register(s).
NOTE: THIS PAGE APPLIES TO REV. 1.81–1.83

17 (0x11) REPORT SLAVE IDENTIFICATION* 
This query requests from the specified slave address a detailed identification packet with a run status, and Sage Prime and firmware revision response. (Prime will not respond to broadcast slave address 00.)

Query
The query message specifies the slave address, function code, and CRC check words.

---
17 (0x11) REPORT SLAVE ID
---

<table>
<thead>
<tr>
<th>QUERY</th>

</tr>
<tr>
<td></td>
<td>CL</td>
</tr>
</tbody>
</table>

Response
The Sage Prime will respond with an echo of the slave address and function code. The byte count will be 19 (0x13) to allow the master to account for all the remaining bytes that follow.

REPORT SLAVE ID Example: (Slave Address = 0x30 = 48, default)
Master Query --> 30 11 DS BC
Prime Response --> 30 11 13 5A FF 53 61 67 65 20 50 72 69 6D 65 20 76 31 2E 38 31 20 FF 21 2B
ASCII translation --> Sage Prime v1.81

ILLEGAL FUNCTION CODES*
The Sage Prime will respond to other Modbus function codes not documented in this revision, these codes are considered unsupported by Sage Metering. Unsupported function codes will cause the Prime to reply with Modbus ILLEGAL FUNCTION status.

*Not implemented in revision 1.80

*NOTE: Sage Prime Meters are factory programmed with the MODBUS slave address = 48 (0x30). It may be extremely useful to be able to write to an unknown slave address with a simple broadcast command. Be sure only one Sage Prime is connected during any broadcast writes using slave address = 0.

Writing into unspecified registers (not defined above) can render the unit non-functional or overwrite factory calibration data yielding incorrect operation.

### EXAMPLE MODBUS PACKET

**Query**

This packet will request of the addressed slave to respond by sending back the contents of registers 578 to 582 (inclusive). Three registers: flow rate through RTD mWatts in IEEE754 floating point format.

0x31 – SAGE PRIME SLAVE ADDRESS (0x31 Hex = 49 Decimal default)
0x04 – READ INPUT REGS FUNCTION CODE
0x02 – STARTING REGISTER HI BYTE (0x01 = 256, 0x02 = 512, 0x03 = 768)
0x42 – STARTING REGISTER LO BYTE (512 + 66 = register access = 578)
0x00 – COUNT MSB (ALWAYS ZERO)
0x06 – COUNT OF ALL DESIRED REGISTERS
0xD5 – CRC HI BYTE
0x85 – CRC LO BYTE
Sage Register Output Format

**INTEGER REPRESENTATION**

Computer systems hosting a MODBUS network typically store integer values to represent non-fractional quantities.

All registers addressed above 256 (0x0100-0x1FF) will transfer 16 bit integral quantities in response to all master queries. MODBUS requires that the register count reflects each 16 bit registers transmitted to ensure that no bytes are missing in the transfer of integer quantities. (Note: Most Sage Prime registers are IEEE754 quantities; integer representations of these registers will require significant translation.)

**IEEE754 FLOATING POINT**

Computer systems hosting a MODBUS network typically store single precision floating point data in the standard IEEE754 format.

All registers addressed above 512 (0x0200-0x02FF) will transfer full 32 bit single precision quantities in response to all master queries. MODBUS requires that two 16 bit registers are transmitted to ensure that no bytes are missing in the transmission of 32 bit quantities.

**SCALED DECIMAL REPRESENTATION**

Computer systems hosting a MODBUS network may choose represent single precision floating point values as scaled long integers (32 bit values). The Sage Prime will convert floating point registers to integral units by multiplying the value by 1000.

Ex. Floating point value 1234.567 will be converted to integral value 1234567

All registers addressed above 768 (0x0300-0x03FF) will transfer full 32 bit scaled integer quantities in response to all master queries. MODBUS requires that two 16 bit registers are transmitted to ensure that no bytes are missing in the transmission of 32 bit quantities.

For more information on the MODBUS protocol, see: http://www.modbus.org/tech.php

**SAGE ADDRESSER SOFTWARE**

Addresser is a convenient software kit that includes Addresser software, as well as an optically isolated ULINX RS485 to USB converter. The Addresser is a READ/WRITE Program with drop-down menus for convenient user interface between your PC or laptop and the Modbus Terminals of the Sage Prime. Contact Sage for ordering information and instructions.

**SAGE ADDRESSER TECHNICAL ASSISTANCE**

Visit our website at www.sagemetering.com and navigate to the Manuals/Download section (http://www.sagemetering.com/manual.htm). Click on the “Instructional Manuals & Technical Data” button. User name: sage; password: 7243737. Click on link “Click to View ADDRESSER Procedures” and/or “Click to View MODBUS Poll/PRIME Communications Setup Instructions”.

APPENDIX
Sage Prime™ Field Programmable “Dongle”

Although virtually any setting on Sage Prime can be changed by users who have Modbus® capability (see pages 19 and 22 for terminal connections), not all customers have that capability to communicate with the Prime using its Modbus Compliant RS485 Communications. However, users do not need to have a Modbus host or any special skill, since they can also change configurations in the field by using the patent pending Sage “Dongle”.

The Sage Prime device known as a “Dongle”, was developed to facilitate making changes on Sage Prime Flow Meter settings in the field. Simply contact Sage and specify your requirement (such as the new Full Scale, new Pipe Area, etc), and the device will be programmed at Sage and sent directly to you within a few days (there is a slight fee for this service). The patent-pending Dongle can also be configured as a Reset Totalizer device (i.e. it can be used repeatedly, with any Sage Prime to easily reset the Totalizer). The Dongle can also be programmed to change Engineering Units, Filter Response and numerous other parameters.

In fact, Dongles can also be used to provide multiple gas calibrations. In this case, the requirements must be specified at the time of ordering. For example, one meter can be calibrated for four different gases with totally different calibration ranges, by providing four Dongles with the Flow Meter. When a different gas calibration is needed, simply upload the data from the appropriate Dongle. It only takes a few seconds to do so.

Dongles come with a convenient well marked cable that is connected to the RS485 terminals. Simply remove the rear cover, connect the Dongle, and push the button on the Dongle. An LED will illuminate, and within 3 seconds the light will go out signaling that the data transfer is complete. Remove the Dongle, close the cover, and you will notice that the new settings have been uploaded (or in the case of a Totalizer-Reset Dongle, you will notice that the Totalizer has zeroed).

1 If the light does not go out, it will be necessary to repeat procedure. Remove finger for a few seconds and then push button again.
Correction Factors For Variation From Original Digester Gas Calibration

Sage can calibrate for any Digester Gas, Bio Gas or Landfill Gas Mix. However, it may be helpful to have correction factors for a typical calibration, in the event that the composition changes after delivery. The following examples assume that the initial calibration was set up for 60% CH4 and 40% CO2.

a) 65% CH4 and 35% CO2: Multiply reading by 0.982 to correct it for new composition

b) 70% CH4 and 30% CO2: Multiply reading by 0.965 to correct it for new composition

c) 55% CH4 and 45% CO2: Multiply reading by 1.0185 to correct it for new composition

For smaller changes, the corrections are linear in between

For applications where condensation may develop on inside wall of pipes

d) Also, if 100% saturated with H2O vapor (non-condensing), multiply readings by 1.042

e) If 50% saturated with water, multiply reading by 1.021

(Water vapor correction is linear in between)

Also, use the 45 degree mounting method in order to avoid droplets from hitting the sensor and causing spikes (see above right)
J-Box and Upstream Orientation

What is a Thermal Mass Flow Meter?

- What is a Thermal Mass Flow Meter? It is a meter that directly measures the gas mass flow based on the principle of conductive and convective heat transfer.

- All Meters have probes (Insertion Style) or Flow Bodies (In-Line Style) that support a pair of sensors, which are in contact with the gas.

- The sensors are RTDs, which are resistance temperature detectors. They consist of highly stable reference-grade platinum windings. In fact, we use the same material that is used as Platinum Resistance Standards at the NIST.

- The RTDs are clad in a protective 316 SS sheath for industrial environments.

- One of the RTDs [See Diagram below] is self-heated by the circuitry and serves as the flow sensor. The other RTD acts as a reference sensor, and measures the gas temperature. Essentially it is used for temperature compensation.

- The Sage proprietary sensor drive circuitry maintains a constant overheat between the flow sensor and the reference sensor. As gas flows by the heated sensor (flow sensor), the molecules of flowing gas carry heat away from this sensor, and the sensor cools down as it loses energy. The circuit equilibrium is disturbed, and momentarily the temperature difference between the heated sensor and the reference sensor has changed. The circuit will automatically (within 1 second) replace this lost energy by heating up the flow sensor so the overheat temperature is restored.

- The current required to maintain this overheat represents the mass flow signal. There is no need for external temperature or pressure devices.
